Authenti

MySQL 8 supports a new authentication based on improved stronger SHA256-base password methods. It is recommended that all new MySQL Server installations use this method voing forward.

Attention: This new authentication plugin on the server side requires new version of connectors and clients which add support for this new 8.0 default authentication (caching sha2 password authentication).

Currently MySQL 8.0 Connectors and community drivers which use libmysqlclient 8.0 sup this new method. If clients and applications cannot be updated to support this new authentication method, the MySQL 8.0 Server can be configured to use the legacy MySQ Authentication Method below.

Use Legacy Authentication Method (Retain MySQL 5.x Compatibility)

Using the old MySQL 5.x legacy authentication method should only be considered in following cases:

- If applications cannot be updated to use MySQL 8 enabled Connect
- For cases where re-compilation of an existing application is not feas
- An updated, language specific connector or driver is not yet availabl

Security Guidance: When possible, we highly recommend taking need upgrading your applications, libraries, and database servers to the new This new method will significantly improve your security.
